Questions & Answers About mcdougal earths atmosfer answer key study guide

N o	Question	Answer
1	What are the main layers of Earth's atmosphere and how are they distinguished?	The main layers are the troposphere (weather occurs here), stratosphere (ozone layer is found here), mesosphere (meteors burn up), thermosphere (satellites orbit here and aurorae occur), and exosphere (outermost layer). They are distinguished by temperature changes with altitude.

2	How does atmospheric pressure change as you move higher in the atmosphere?	Atmospheric pressure decreases significantly as you move higher. This is because there are fewer air molecules above you to exert pressure.
3	What is the significance of the ozone layer and where is it located?	The ozone layer is crucial for life on Earth as it absorbs most of the Sun's harmful ultraviolet (UV) radiation. It is primarily located in the lower portion of the stratosphere.
4	What are the primary gases that make up Earth's atmosphere?	The Earth's atmosphere is composed mainly of nitrogen (about 78%) and oxygen (about 21%), with smaller amounts of argon, carbon dioxide, and trace gases.
5	How does temperature generally behave as you ascend through the troposphere and stratosphere?	In the troposphere, temperature decreases with increasing altitude. In the stratosphere, temperature generally increases with increasing altitude due to the absorption of UV radiation by the ozone layer.
6	What is the greenhouse effect and how does it relate to Earth's atmosphere?	The greenhouse effect is a natural process where certain gases in the atmosphere (like carbon dioxide and methane) trap heat from the sun, warming the planet. It's essential for maintaining Earth's temperature for life, but an excess can lead to global warming.
